No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. £45296
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Farnandes-Alnemri, Teresa
APPLICANT: Litwack, Gerald
TITLE OF INVENTION: Apoptotic Protease Mch6, Nucleic Acids
TITLE OF INVENTION: Encoding Same and Methods of Use
NUMBER OF SEQUENCES: 87
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                               COMPUTER READABLE FORM:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to P
score greater than or equal to the score of the result beir
and is derived by analysis of the total score distribution.

This is a human interleukin-1 beta converting enzyme apoptosis protease-6 (ICE LAP-6) polypeptide. The ICE LAP-6 polypeptide and agonists to the polypeptide can be used to induce apoptosis, e.g. as an antivital or antiviturour agent, control embryonic development and tissue homeostasis and the roles of such factors in dysfunction and disease. Antagonists which inhibit the activity of the ICE LAP-6 polypeptide can be used to treat, Alzheimer's or Parkinson's disease, rheumatoid arthritis, septic shock, sepsis, stroke, chronic, acute or central nervous system inflammation, ostcoporosis, ischaemia reperfusion injury, cell death associated with cardiovascular disease, polycystic kidney disease, apoptosis of endothelial cells in cardiovascular disease, degeneration, ischaemic injury, myocardial infarction, acquired immunodeficiency syndrome (AIDS) myelodysplatic syndrome, aplasic anaemia, male pattern baldness and 0 DLETRGSQALPLFISCLEDTGQDMLASFLRTNRQAGKLSKPTLENLTPVVLRPEIRKPEV 120 240 ASHLOFPGAVYGTDGCPVSVEKIVNIFNGTSCPSLGGKPKLFIQHCGGGGQKDHGFEVAS 300 TSPEDESPGSNPEPDATPFQEGLRTFDQLDAISSLPTPSDIFVSYSTFPGFVSWRDPKSG 360 9 9 They can also be used for detection and diagnosis. The present sequence is an alternative version of human Caspase-9 also known as interleukin-1 converting enzyme (ICE) LAP6 and Mch6. Caspases are a family of cysteine proteases, that participate in the initiation and execution of apoptosis. Caspases exist as pro-enzymes, activated by cleavage into a large and small subunit, occurring after specific aspartic acid residues within the pro-enzyme sequence.

The present invention relates to a method for functional cloning of genes encoding proteins or enzymes involved in proteolytic cleavage. The encoding sequence of a proteolytic cleavage site flanked by sequences to the use of Caspase expression cassettes comprising the coding sequence of a proteolytic cleavage site flanked by sequences of an as second caspase subunits. P fusion polypeptide comprising a first and a second caspase subunit. Per separated by a cleavage site not associated in nature, is useful for cloning gene encoding enzymes involved in proteolytic cleavage. An expression cassette containing fusion properties is useful to also useful for diagnosis and suppression of enzyme of interest and is also useful for diagnosis and suppression of proliferation or metastases of a tumour cell characterised by 105-107 (See AAE00620) in the specification. However these Gaps as that selectively expressed in the tumour cells). DNA encoding fusion polypeptide is used in gene therapy.

Note: This sequence SEO.ID.NO.18 is stated as being the same as ; 0 overexpression of a polypeptide (e.g. Cathepsin B or urokinase, Query Match

Rev-caspases are cysteine proteases that specifically cleave proteins after Asp residues and is expressed as a zymogen, in which the small subunit is N-terminal to a large subunit. A gene delivery vehicle comprising a rev-caspase coding sequence is useful for the treatment of cancer, where the gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle can also be used to treat autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                              Rev-caspase, cysteine protease, zymogen, caspase, cancer, gene therapy, autoimmune disease, caspase-mediated apoptosis, neurodegenerative, tumour cell; myocardial infarction; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          360
                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                   9
Cells transfected with a rev-caspase expressing vector can be used in identification of inhibitors or enhancers of caspase-mediated apoptosis. In vitro translated rev-caspase can be used to identify an inhibitor or enhancer of caspase processing activity. Caspase inhibitors are useful for treating neurodegenerative diseases as well as for inhibiting apoptosis in the heart following myocardial infarction. Sequences AAX81217 -AAX81226 represent human caspase genes encoding caspase 1-10 gene products (AAY21715-Y21724).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TSPEDESPGSNPEPDATPFQEGLRTFDQLDAISSLPTPSDIFVSYSTFPGFVSWRDPKSG
                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated gene encoding apoptic protease, mammalian ced-3 homologue 6 (Mch6). Mch6 is a member of the apparate-epecific cysteine procease (ASCP) family. Mch6 DNA and protease are useful for modulating apoptosis for the therapeutic treatment of human diseases. Mch6 sequences are useful for upregulating apoptosis (e.g. for treating cancers, autoimmune disease or viral infections) or downregulating apoptosis (e.g. for treating Alzheimer's disease, Parkinson's disease or cerebellar degeneration). The Mch6 sequence is useful for diagnosing, treating or reducing the severity of cell death-mediated diseases, as well as other diseases mediated by either increased or decreased programmed cell death. The present amino acid sequence is Mch6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SWYVETLDDIFEQWAHSEDLQSLLLRVANAVSVKGIYKQMPGCFNFLRKKLFFKTS

2001-540372/60 N-PSDB; AAH77927 Identifying mammalian homolog ced-3 homolog (Mch)6 activity modulators, useful for treating lymphomas, carcinomas and hormone dependent tumours, Alzheimer's disease, Parkinson's disease, comprises using Mch6 polypeptide

Example 1; Fig la-c; 36pp; English

The present sequence represents a human Mch6 polypeptide. Mch6 is a ced-3 homologue, and is a member of the ICE (interleukin-1-beta converting enzyme) family of apparate-specific cysteine proteases (AsCPB). The compounds identified by the gpecification describes a method foor identifying mammalian Mch6 activity method are useful as pharmaceuticals for treating or preventing diseases contacterized by increased apoptotic cell death such as Alzheimer's disease, Parkinson's disease, amyotropic lateral sclerosis, retinitis characterized by increased apoptotic cell death such as Alzheimer's contacterized by increased apoptotic in welodysplastic syndromes such as aplastic anemia, ischemic injury including uyocardial infarction, stroke and reperfusion injury. The compounds are also useful for treating diseases characterized by loss of "riptotic cell death such as cancers, e.g. lymphomas, carcinomas and "mone dependent tumours as cancers, e.g. lymphomas, carcinomas and "mone dependent tumours cancer in a breast, prostate and ovarian cancer increased cell survival in infactions such as results in aut mune diseases such as systemic lupus erythematosus and immune-med ced glomerulonephritis as well as viral infections such as herpes vir s, pox virus and adenovirus conditions the movel identified compounds are usef if for treating these The Mch6 inhibitors are used to treat or to reduce severity diseases characterized by increased programmed cell death conditions.

Isolated gene encoding a human apoptotic protease known as Mch6, useful in the diagnosis or treatment of cell death-mediated conditions, e.g. cancers and autoimmune diseases such as systemic lupus erythematosus

CLaim 8; Fig 1A-C; 15pp; English.

The present sequence represents a human apoptotic protease, designated Mch6. Mch6 is an aspartate specific cysteine protease. Mch6 polypeptides and polynucleotides can be used to diagnose, treat or reduce the severity of cell death-mediated conditions, e.g. cancers, autoimmune diseases such as systemic lupus erythematosus, viral infections such as herpesvirus, degenerative disorders such as Alzheimer's disease and Parkinson's disease, myclodysplastic syndromes such as myocardial infarction and stroke. They can also be used to screen for compounds that inhibit or promote Mch6 mediated apoptosis.

The invention relates to an isolated gene encoding MCH6 (mammalian ced-3 homologue 6) an aspartate specific cysteine protease and the MCH6 polypeptide. The MCH6-encoding nucleic acids and polypeptides can be used to diagnose, treat (e.g. by gene therapy) or reduce the severity of cell death-mediated diseases (i.e. apoptotic) such as neurodegenerative disease, all steral sclerosis, retinitis pygmentosa and cerebellar degeneration, and myelodysplastic syndromes. e.g. aplastic anaemia, ischaemic injury, myocardial infarction, stroke and reperfusion injury. The MCH6-encoding nucleic acids and polypeptides can also be used to diagnose or generate regents to diagnose diseases mediated or characterised by programmed cell death. A purified recombinant MCH6 protein can be used to measure hydrolysis rates for various substrates such as DEVD-AMC and YYAD-AMC in and continuous fluorometric assay. The present sequence represents human acres

                                                                                                                                                                                                                                        a
                                                                                     ሯ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to determining a prognosis for survival for a cancer patient. The method involves (a) mearuring a level of a tumour upregulated CARD-containing antagonist of caspase-9 (TUCAN) in a neoplastic cell-containing sample from the cancer patient and (b) comparing the level of TUCAN in the sample to a reference level of TUCAN, where a low level of TUCAN in the sample correlates with increased survival of the patient. Alternatively, the method involves measuring levels of TUCAN and one or more biomarkers selected from the group of CARD2, Apafl, Bel-2, or smac in a neoplastic cell-containing sample from the cancer patient. The method is useful for determining if the patient is at risk for relapse, or for determining a proper course of treatment for a patient with cancer. The method is also useful for monitoring the effectiveness of a course of treatment for a patient with cancer, e.g. colon cancer, gastrointestinal cancer, breast cancer, ovarian cancer, lung cancer. The method is also useful cancer, ovarian cancer, lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240

interleukin-1 converting enzyme (ICE) LAP6 and Mch6. Caspases are a family of cysteine proceases, that participate in the initiation and execution of apoptosis. Caspases exist as pro-enzymes, activated by cleavage into a large and small subunit, occurring after specific aspartic acid residues within the pro-enzyme sequence. The present invention relates to a method for functional cloning of genes encoding proteins or enzymes involved in proteclytic cleavage. The invention is based on the use of caspase expression cassettes comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the coding sequence of a proteolytic cleavage site flanked by sequences encoding two caspase subunits. A fusion polypeptide comprising a first and a second caspase subunit, serarated by a cleavage site not associated in nature, is useful for cloning gene encoding enzymes involved in proteolytic cleavage. An express on casette containing fusion polypeptide is used to identify a mutant cell line deficient in an enzyme of interest and is also useful for diagnosis and suppression of

This is an amino acid sequence variant of human interleukin-1 beta converting enzyme apoptosis protease-6 (ICE LAP-6) polypeptide. The ICE LAP-6 polypeptide and agonists to the polypeptide can be used to induce apoptosis, e.g. as an antiviral cr antitumour agent, control embryonic development and tissue homeostasis and the roles of such factors in dysfunction and disease. Antagonists which inhibit the activity of the ICE LAP-6 polypeptide can be used to treat, Alzheimer's or Parkinson's disease, rheumatoid arthritis, septic shock, sepsis, stroke, chronic, acute or central nervous system inflammation, osteoporosis, ischaemia repertusion injury. Cell death associated with cardiovascular disease, polycystic kidney disease, apoptosis of endothelial cells in cardiovascular disease, apoptosis of endothelial cells in cardiovascular disease, apoptosis of endothelial infarction, cerebellar degeneration ischaemia infury, myocardial infarction, aplastic annemia, male pattern baldness and head injury damage. They can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0

The invention relates to an isolated intracelluiar signaling polypeptide, termed Nod2, comprising a sequence of 1007 or 1040 amino acids, given in the specification. The nucleic acid encoding the isolated protein is useful for identifying subjects at risk of developing Crohn's disease by providing a nucleic acid from the subject, where the nucleic acid comprises a Nod2 gene, and detecting the presence or absence of one or more variations in the Nod2 gene, Detecting the presence of a beence of one or acid. Detection is accomplished by hybridisation analysis. The method further comprises determining if the subject is at risk of developing Crohn's disease based on the presence or absence of the variations, and ceremining a genotype relative risk or a population attributable risk for the subject. The variation is a polymorphism or a mutation causes or preferably a cytosine residue insertion, where the mutation results in increased nuclear factor (NF)-B activation. The variation is selected from the sequences of the Nod2 gene. The isolated protein is useful as a nucleic acids for directed evolution, for the variation is useful for producing the isolated protein by reconnant techniques, as starting or producing the isolated protein by reconnant techniques, as starting for producing the isolated protein by reconnant techniques, as compared to wild-type plants, plant tissues or plant cells as compared to wild-type plants, plant tissues or plant cells. This sequence represents a Nod2 related protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 MDEADRRLLRRCRLRLVEELQVDQLWDVLLSRELFRPHMIEDIGRAGSGSRRDQARQLII

                                                                                                                                                                                                                                                                                                                                                                                           4
                                                                                                                                                                                       A method for identifying drugs which exhibit apoptosis-controlling activity involves the use of a human Nrf2 protein. Nrf2 is a caspase substrate. The method involves detecting cleavage of the Nrf2 protein by caspase in the presence of a candidate drug. Prection of cleavage of the Nrf2 protein by caspase in the presence of a addite drug indicates suppostes inducing activity. The method can be used for selecting a drug which can be used for the prevention and the treatment of various diseases caused by abnormality in apoptosis control, such as cancer. The present sequence represents the human caspase-1 protein used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   42; Caps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is the CPP21beta or Glu190 isoform of the inactive CPP32 procentyme (a member of the interleukin converting enzyme/pro-apoptotic protein CED-3 family of cysteine proteases of unknown function cloned from Jurket cells), the proteolytic product of which is the polylp-ribose) polymerase (PARP) protease, apopain. The PARP cleavage enzyme was purified from the human monocytic leukaemia cell line, THP-1, using standard ion exchange chromateography techniques and SDS PAGE. Apopain can be used to identify apopain activity modulators, while apopain encoding DNA may be used for apopain production or in gene therapy (i.e. in vivo or ex vivo gene transplantation) for enhancing the pro-inflammatory or pro-apoptotic effects of apopain. Anti-apopain antibodies and antisense DNA can be used to reduce or eliminate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vaillancourt JP;

PTM: CLEAVAGE BY GRANZYME B, CASPAGE-6, -8 AND -10 GENERATES THE TWO ACTIVE SUBMUNITS. ADDITIONAL PROCESSING OF THE PROPEPTIDES IS LIKELY DUE TO THE AUTUCATALITIC ACTIVITY OF THE ACTIVATED PROTEASE. ACTIVE HETERODIMERS BETWEEN THE SMALL SUBUNIT OF CASPAGE. 7 PROTEASE AND THE LARGE SUBUNIT OF CREAS (BY SIMILARITY).

SIMILARITY: BELONGS TO PEPTIDASE FAMILY C14.

                                                                                                                                                           ENZYME REGULATION: INHIBITED BY ISATIN SULFONAMIDES.
SUBGNIT: HETERODIMER OF A 17 kDa (P17) AND A 12 kDa (P12) SUBUNIT.
SUBGELLULAR LOCATION: CYCOPLAGME.

TISSUE SPECIFICITY: HIGHLY EXPRESSED IN LUNG, SPLEEN, HEART, LIVER
AND KIDNEY. MODERATE LEVELS IN BRAIN AND SKELETAL MUSCLE, AND LOW
IN TESTIS. ALSO POUND IN MANY CELL LINES, HIGHEST EXPRESSION IN
CELLS OF THE IMMUNE SYSTEM.

PTM: CLEAVAGE BY GRANZYME B, APAF-1, CASPASE-6, -8 AND -10
PTM: CLEAVAGE BY GRANZYME B, ADDITIONAL PROCESSING OF THE
PROPEPTIDES IS LIKELY DUE TO THE AUTOCATALYTIC ACTIVITY OF THE
ACTIVATED PROTEASE. ACTIVE HETERODIMERS BETWEEN THE SMALL SUBUNIT
OF CASPASE-7 PROTEASE AND THE LARGE SUBUNIT OF CPP32 ALSO OCCUR
is modulated by the polyglutamine tract.";

Nat. Genet. 13:442-495(1996)

-1- FUNCTION: INVOLVED IN THE ACTIVATION CASCADE OF CASPASES

RESPONSIBLE FOR APOPTOSIS EXECUTION. AT THE ONSET OF APOPTOSIS IT

PROTECULYTICALLY CLEAVES POLY (ADP. TRIBOSE) POLYMEASE (PRAPE) AT A

216-ASP-1-GLY-217 BOND. CLEAVES AND ACTIVATES STEROL REGULATORY

RIEMENT BINDING PROTEINS (SREBPS) BETWEEN THE BASIC HELIX-LOOP-
HELIX LECTURE STEPER DOWALN AND THE MEMBRANE ATTACHMENT DOWAIN.

CLEAVES AND ACTIVATES CASPASE-6, -7 AND -9. INVOLVED IN THE

CLEAVES OF HUNTINGTIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hydrolase; Thiol protease; Zymogen; Apoptosis; Polymorphism;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ISLDNS -- MSWDTG (IN REF. 3)
